

Technical Perspectives on Analyst's Rating Changes

MDT case study

02-16-2008

MDT – The TPARC report from March 31, 2006 described MDT as "performing poorly" and being below the 45-degree Bearish Resistance Line. The resistance proved to be too great and the stock broke down into a serious downtrend. The current price is only slightly below the price on the TPARC report but the relative performance has been very bad. It remains below the 45-degree Bearish Resistance Line currently.
